From the blog on Wednesday, April 21, 2010:

Who needs a GPS

With the future looking like the surrounding towns are going to grant the permits for the new wind turbine, will you still need to have a GPS? With this monster coming it will be the new point to look for when heading home to Keyport!

The new wind turbine tower is slated to be 380 feet high! Did you know that the Parachute Jump at Coney Island was 200 feet high? With the wind turbine set to be 180 feet higher and the blades 190 feet wide you will be able to see this monster from the other side of Sandy Hook and then some.

We like this proposal, and even think going green is a great thing, but do you really think this installation will lower your utility bills? Why not put these towers in the ocean where they are not impacting the daily lives of you and me? They look better and work better and the bases make good fishing spots too.

When the real estate market dropped and houses depreciated at record levels right after the last town evaluation, did they drop your property taxes as well? Not mine! So what do you think now, wake up and smell the coffee. This new technology is great, as long as they don't put it near

my house. So good luck with that installation, and enjoy the view as this structure will be in every photo frame.

I'm sure they will even rent out space on the new tower to all the cell phone companies, to make even more money. Hey don't forget to put a Verizon antenna on that tower, as the service is terrible at the Club!
